

Dr. Joan Franks, a local Tucson Neurologist deals daily with the diagnosis and treatment of diseases involving central, peripheral, and autonomic nervous systems. When Dr. Franks approached us to design her new medical suite we were delighted to create a compact design which met her programmatic needs and budget. Although small when compared to other medical suites, this modest office boasts a large amount of storage and generous office/medical exam rooms.

Locally adopted energy codes require fluorescent fixtures for today's suite build outs. Due to neurological problems which involve function of cranial nerves (including vision) the doctor requested that fluorescent lights be discernibly flicker free to the human eye and placed appropriately in relation to requested ceilings so any and all flickering may be eliminated.

To round out the design new exterior doors and windows were also added to the building allowing access to a new exterior patio area.
